

INCREASE RELIABILITY, REDUCE COSTS

UPDATE YOUR PLANT'S AUTOMATION SYSTEM
ON THE ADVANCED SIEMENS SIMATIC S7

For businesses to remain competitive in the long term, their equipment should be adapted to the ever-increasing demands. As we have already entered the era of the fourth industrial revolution (Internet of Things-IoT), the competition is heating up. The necessary modernization of the automation system will bring significant improvements in reliability, productivity, profitability and at the same time will provide significant cost savings and a substantial Return On Investment (ROI).

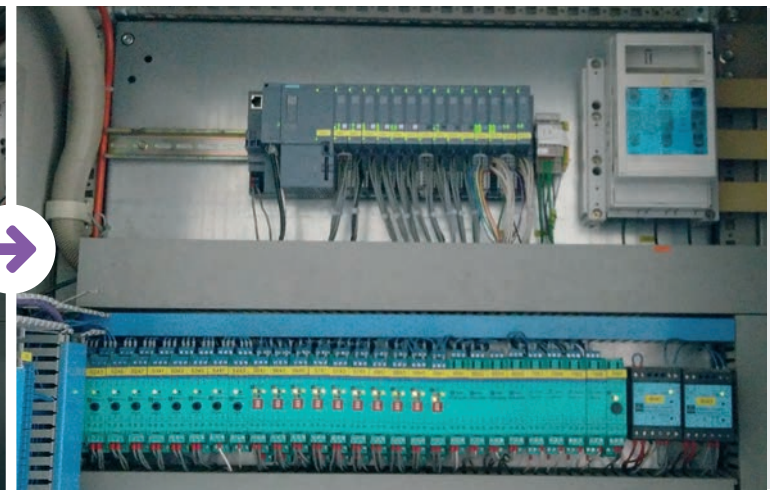

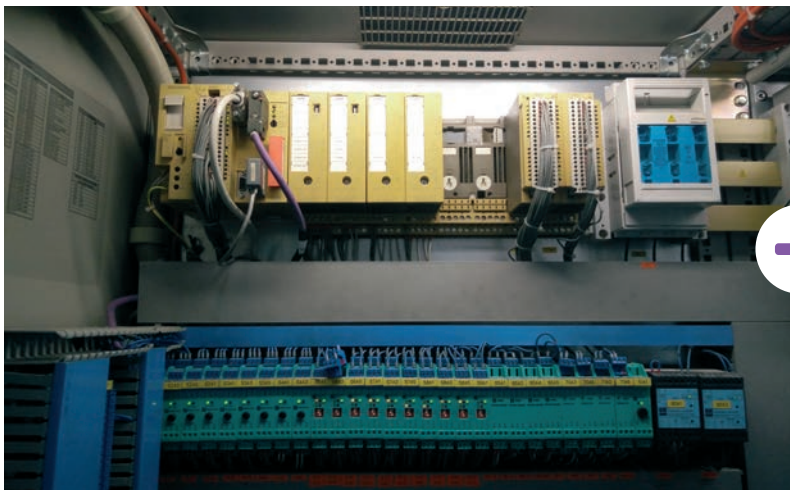

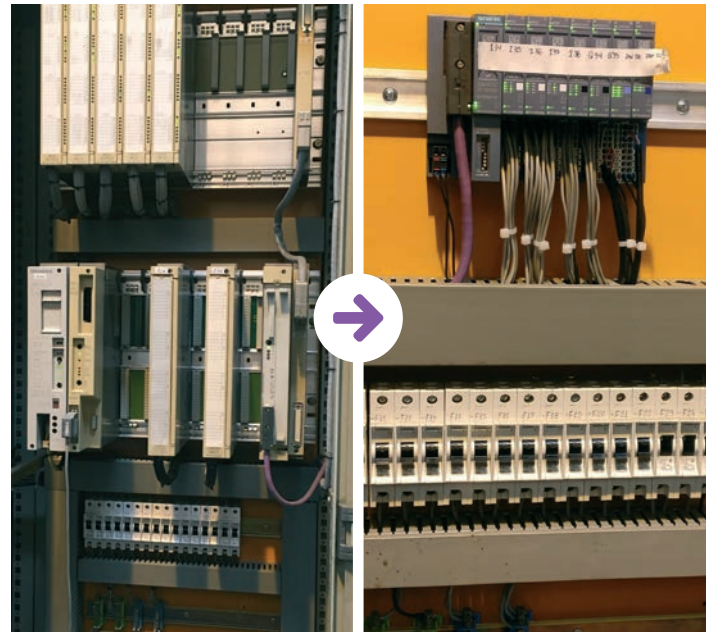

WHY YOU SHOULD UPGRADE YOUR AUTOMATION SYSTEM

- The reliability of automation materials decreases over time. The chances of malfunction and downtime as a result are increasing.
- Outdated automation materials such as SIMATIC S5 are no longer supported. Parts and materials are scarce and hard to find. If found, their price is much higher than the new ones.
- The programming of old automation systems is difficult because there are not many developers actively engaged in them. As a result, programming for expansion, maintenance or technical support, becomes unreasonably expensive.
- The modern materials of the SIMATIC S7 series, support functions that are not feasible with the equipment of previous decades.

HOW THE CHANGE AFFECTS YOUR OPERATION

At AS Automation System Hellas we have extensive experience in dismantling old automation systems (mainly SIMATIC S5) and replacing them with modern SIMATIC S7 automation materials.

Such replacements are complex projects with several parameters to consider and each time the project conditions are different. AS Automation System Hellas has standardized the process so that with the proper preparation you need the least possible interference in your production schedule.

WHAT WE OFFER

Depending on your requirements, we can offer you the following:

- Replacement of the automation material in the existing panel or construction of an entirely new panel
- Reliable translation of the existing automation program into the program that supports SIMATIC S7, or development of the automation program from scratch
- SCADA system upgrade
- Process optimization
- Staff training
- Continuous technical support
- Spare parts for your system
- Guarantee of good operation

This process has been implemented in many small and large installations (from Siemens and other manufacturers), and has always been an absolute success.
